

New Holland In-Cab Radar Connector

New Holland Single pin "In Cab" outlet for TG and TJ Series Tractors. Usually located to the right of the dash near the power outlet.

Mating connector used to transmit radar signal to monitors. This is the connector on our cable.

4491

Adapter cable that hooks to most common planter monitors, all other Dickey-john controllers and monitors. Cable has a 4 pin AMP Lock Ring Connector with signal and ground contacts. Pins 3 and 4 are looped to provide radar sense to older Dj built planter monitors (PM3000, VM1600 etc.)

For Hiniker applications when used with our H-100 Splitter. For Micro-Trak applications when used with our MT-100 Splitter.

4492

Raven Adapter Cable – works with Raven or FMC Capture systems.

4493

Adapter cable that goes directly to a Hiniker splitter that has a 3 pin Sure Seal push in input connector. Always check to see what kind of connector is on the splitter they are using and match to it. If we are going to a new application, use a 4491 to an H-100 Splitter which has standard AMP 4 pin input.

4494

Rawson Adapter Cable, same as 4491 without a loop on pins 3 and 4 used in older planter monitors. This works better on Rawson or Smart Boxes.

4499

Spraying Systems T-Jet Adapter with triangle shaped Deutsch connector.

1695-0009

General part number for a two outlet adapter. This would be common for someone wanting a planter monitor and a Rawson. You must specify which two output connectors are needed.

1696-0009

General part number for a three outlet adapter. This would be common for someone wanting to use a planter monitor, a Rawson Control and a Raven Spray Control. You must specify which three output connectors are needed. There are some specific applications with their own part numbers for the Capture Controls. See 1696-0041, 0042 and 0043.

4491-13

Two outlet adapter specifically configured with one AMP 4-pin for conventional Dj build Seed Monitors and the second lead for FMC Capture or Raven Controls.
